

Improving Visual Communication of Weather Forecasts with Rhetoric

K. M. LAMBRECHT, B. J. HATCHETT, L. C. WALSH, M. COLLINS, AND Z. TOLBY

Effective communication of weather forecasts and related hazards, particularly levels of forecast confidence, to the general public represents a continual challenge for operational meteorologists. The approach to communication of high-impact weather events has immediate implications for life and property as well as developing longer-term community resilience to extreme events. Building on research that suggests that bringing together multiple types of expertise is important to science communication (e.g., Fischhoff 2013), we sought an interdisciplinary approach, combining the work of meteorology and rhetoric to strengthen communication with public audiences. Using a rhetorical framework reveals how we can build trust with the public by 1) inviting audience participation, 2) providing a way for users to distribute weather information to others, and 3) encouraging interactions that increase solidarity with the public. Our initial results suggest that visual communication incorporating the rhetorical concept of “commonplaces” used by the public can support effective National Weather Service communication.

Commonplaces are the expressions of beliefs, values, and norms that construct community

attitudes toward subjects like weather or natural hazard forecasts (Locke 1999; Prelli 1990). For example, the decision to change driving routes to avoid hazardous snow communicates a value of keeping oneself safe, a commonplace that is shared across many members of the community. Understanding community values and using those commonplaces in forecasting is a way to build what Earle (2010) would call “relational trust” because using shared language in weather communication builds a foundation of resilience between meteorologists and the public, helping to sustain the relationship through moments of uncertainty.

The National Weather Service (NWS) has experienced a rapid evolution of forecast communication since it began disseminating forecasts, warnings, and advisories on social media in 2011 as part of the “Weather Ready Nation” initiative. This initiative furthers previous research that suggests that encouraging public involvement is important in science communication (National Academies of Sciences, Engineering, and Medicine 2017) and that science is communicated within a larger network of social concerns (Maynard and Scheufele 2016). In addition to using outlets such as Facebook (FB) and Twitter to

Visual Communication of Probabilistic Information to Enhance Decision Support

ABSTRACT: When hazardous weather is forecast, communicating probabilistic information (PI) can improve trust, confidence, and understanding of forecast information, resulting in improved decision-making by emergency managers and public audiences. With probabilistic forecast tools modernizing forecast operations, the National Weather Service is calling on regional offices to increase the use of PI. However, communicating PI can be challenging since the information is intrinsically more complex than single-value deterministic forecasts that do not include a measure of uncertainty. We suggest that effective PI visualization not only includes the PI graphic but also communicates potential impacts and issues preventative guidance to limit exposure to weather-related hazards. Decision support tools like PI benefit from, if not require, effective visual communication that capitalizes on the efficiency of the visual system to extract information, decrease the time to interpret information, and increase the understanding of uncertainties. Furthermore, PI visuals need to be accessible to disabled and neurodivergent audiences. To enhance the visual communication of PI, we synthesize literature from graphic design and social science to identify guiding principles for effective visual communication and provide a one-page printout quick guide. To showcase how forecasters can incorporate guiding principles in the local context, we provide examples built from readily usable templates to demonstrate how probabilistic forecast information extracted from tools like the National Blend of Models can be used to enhance the visual communication of PI to support more informed decision-making.

Biden-Harris Administration Launches New Efforts to Address the Wildfire Crisis

WASHINGTON, Jan. 19, 2023 – Today, Agriculture Secretary Tom Vilsack announced expanded efforts to reduce wildfire risk across the western U.S. These investments, made possible through President Biden's landmark [Bipartisan Infrastructure Law \(BIL\)](#) and the [Inflation Reduction Act \(IRA\)](#), will directly protect at-risk communities and critical infrastructure across 11 additional landscapes in Arizona, California, Idaho, Nevada, Oregon, Utah and Washington.
